2004 > Phaeton – Missing Underbody Plugs

It is recommended that dealers receiving any Phaetons from transport check the underbody for missing body plugs. Tow-ins and auction vehicles should also be inspected. The body plugs may have been removed to tie down the vehicle during transport and were not reinstalled. Missing body plugs could lead to water and debris infiltration and possible electrical system concerns. To properly install a new body plug: 1) Clean the surrounding area, 2) Apply anti-corrosion wax (D 322 000 A2) to the area, 3) Install the new plug. See illustration 803-36 for plug information in ETKA.
